

Space-time cloak

What's interesting?

Thinking about the invisible cloak in the Sci-fi movie, do you want to own a cloak that can make you invisible? Just like the Star Trek, you can make escape right under the watchful eye of a surveillance camera.

According to new research by British physicists, it is theoretically possible.

How can it be possible?

Not like the invisible cloak in the movie, the space time cloak here is much more complicate. The concept of this is the cloak would bend light around the object. In theory, the device will slowdown the speed of light passing through by using special material filled with metallic arrays.

This will create a safecracker when the light coming into the robbery scene. When this robbery complete, it'll speed up the light to catch back up. There would not be any visible trace, if the “before” and “after” vision are stitched together.
